— powered by EARTH+ —

For business

MEASURE. REDUCE. ACT.

Travel emissions are part of the challenge

Business travel, employee commuting, events and mobility often represent a significant share of an organisation's Scope 3 emissions. Yet these emissions are not always easy to measure, manage or report on.

As sustainability requirements continue to evolve, organisations need more than estimates. They need reliable data, practical tools and credible ways to take action. **Greentripper+ brings these elements together in one integrated solution.**

ONE SOLUTION. THREE STEPS

01

Measure your impact

You cannot manage what you do not measure.

Greentripper enables organisations to calculate the carbon impact of travel and mobility activities through either API integration or a ready-to-use SaaS platform.

Whether you manage business travel, events, employee mobility or customer journeys, Greentripper provides detailed CO₂e insights across teams, departments and activities.

This creates a reliable foundation for sustainability reporting and informed decision-making.

02

Reduce where possible

Once emissions become visible, organisations can identify where meaningful improvements are possible and track the results over time.

Greentripper helps organisations identify the activities that generate the greatest impact and track progress over time. Teams can set reduction targets, monitor performance and integrate sustainability objectives into daily operations.

03

Act on what remains

Even organisations with ambitious reduction programmes will continue to generate emissions.

Through Earth+, businesses support certified climate projects that help accelerate the adoption of biobased materials in construction. This is particularly relevant in a sector that accounts for almost 40% of global CO₂ emissions.

Part of the proceeds flows back to the producers behind these projects, funding the capacity to scale up. Every contribution accelerates the transition itself, not just the project it funds.

This allows organisations to complement their reduction efforts with climate action that reinvests in the change it creates.

BUILT FOR TODAY'S REPORTING REQUIREMENTS.

Growing stakeholder expectations

The solution can help support:

- Scope 3 reporting
- ESG disclosures
- CSRD requirements
- Climate strategy development
- Sustainability communication

By combining reliable measurement with credible action, organisations can strengthen both their reporting and their environmental impact.
